

Armando Minor  
Homework 5  
SER 222

My testing strategy was to allocate more time for this project since I did not have much for the last project. Providing the extra time allowed me to give a more detailed and accurate result. For testing I usually test my work every twenty minutes. This method allows me to calculate how much more time I will need to finish and how much more time its going to take to fix any errors that have arose. Dealing with source code is my biggest challenge and with that I ensure to devote more attention to research regarding coding to ensure efficiency in my future work. With more knowledge on different aspects of coding I am sure to master it going forward.

Considering all the given tasks at hand I was able to create all five necessary methods. The only solution that I could not complete due to time constraints was putting the list into order. Each element was able to be added successfully and removed successfully. With more time on hand I would have implemented the order for the list for each new element added to the list with the corresponding value. In my test cases I was able to run four programs which I created and ran without error. Notes were also added to describe the desired result for each test case.
